

Statement on Heat-Killed Status of Slimbac

Swiss Formula

www.swiss-formula.eu | sales@swiss-formula.eu

Dear valued customers and partners:

We, Swiss Formula, hereby pledge that the postbiotics Slimbac comply with national and international food safety regulations and standards.

We solemnly declare:

The strains contained in this product are fully inactivated (heat-killed) through a validated thermal treatment process.

As a direct result of this inactivation process, the microbial cells are rendered non-viable and cannot replicate.

There is no metabolic activity, eliminating the risk of microbial overgrowth or fermentation in the final application.

The strains are derived from non-pathogenic, food-grade probiotic cultures with a recognized history of safe use, ensuring they are safe for use in food and dietary supplement applications.

We conduct regular quality control testing to verify the absence of viable cells and confirm that the product meets strict safety specifications for heat-killed postbiotics.

We pledge to continue providing safe, healthy, and superior postbiotic products, upholding consumer interests and health.
